

**SCAN FOR
EARLY DETECTION OF
OSTEOPOROSIS**

Osteoporosis is a disease that results in reduced bone mass and strength. Fractures in the hip and spine can result in long term disability and mortality. Women are more prone to osteoporosis than men, especially after menopause. Women who are 45 years old and above, and men who are 65 years old and above are at a higher risk of having this disease. You can screen for this disease by carrying out a Bone Mineral Densitometry (BMD) test which is similar to taking an x-ray.

Check your bones for
Osteoporosis
Come for a **BMD Test**
